

Light reflecting characteristics

- Night visibility depends on the colour and light reflecting characteristics of the pavement surface.
- The glare caused by the reflection of lights is considerably high on wet pavements than on dry pavements.
- Light coloured or white pavements visibility at night but produces glare strain during bright sunlight.
- Black top surface give good sunlight but yields poor visibility at night.

Light reflecting characteristics

- Night visibility depends on the colour and light reflecting characteristics of the pavement surface.
- The glare caused by the reflection of head lights is considerably less on wet pavements than on dry pavements.
- Light coloured pavements give good visibility at night but cause glare and eye strain during bright sunlight.
- Black top surfaces provide good visibility during sunlight but yield poor visibility during night time.
