Prerequisites:(Only for open electives)												
Course Objective:												
To impart the knowledge concepts of different coordinate systems, Maxwell's equations, static electric and magnetic fields and methods of solving for the quantities associated with these fields, time varying fields and displacement current, propagation of electromagnetic waves and their applications involving electromagnetic fields												
Course Outcomes:												
After completion of the course, students would be able to -												
CO1: Acquire knowledge of different coordinate systems, techniques of vector calculus to understand the different concepts of electromagnetic field, time varying fields, polarizations, plane wave in different media. (BL1, BL2).												
CO2: Analyze the behaviour of plane wave in different media, Boundary Condition (BL3, BL4).												
CO3: Apply the principles of electrostatics to the solutions of problems relating to electric field and electric potential, boundary conditions (BL3, BL6).												
CO4: Solve the numerical based on various concepts of electromagnetic field theory (BL3, BL5)

UNITs	Descriptions	Hrs.	CO's
I	Orthogonal coordinate systems, gradient, divergence and curl. Stokes's theorem, gauss's theorem and divergence theorem. transformation of vectors, Static electric fields: Electric flux density, permittivity, Coulomb's law, and electric field intensity, field of distributed charges in free space and line charge, potential function, Laplace's and Poisson's equations, electric dipole, dipole moment, field due to electric dipole. Boundary conditions between conductor and free space and two perfect dielectrics, surface charge distribution, capacitance between two isolated conductors.	9	1,2,3,4
II	Solution of Laplace's equations in systems of dielectric and conducting boundaries, uniqueness theorem, Static current and magnetic fields- current density, mobility, Ohm's law employing mobility. Biot-Savart's law, magnetic field, magnetic field intensity, magnetic flux, and permeability, closed loop currents, Ampere's circuital law in integral and differential vector form, magnetic vector potential. Problems related to straight wire, toroid and cylindrical solenoids. Boundary conditions on magnetic field.	9	1,2,3,4
III	Time varying fields – Faraday's law in integral and differential forms, displacement current concept, Maxwell's equations in differential and integral forms, wave equations in source free region, continuity equation, Poynting vector theorem, complex Poynting vector. Time harmonic fields, Maxwell's equations for TH field, average energy density, duality concept. Helmholtz wave equation, general solution in free space in various coordinates, plane polarized wave in free space, properties of plane waves, wave front, power flow, stored energy density	8	1,2,3,4
IV	Circular and elliptic polarization, resolution in terms of linear polarized waves and vice-versa. Plane waves in lossy medium, low loss dielectric, uniform plane waves in good conductor, loss tangent, skin depth, transmission line analogy, Interference of two plane waves traveling at oblique directions.	7	1,2,4
V	Reflection and refraction of plane waves at dielectric media and conducting Surfaces, Brewster's angle, total internal reflection, resultant fields and power flow in both media. Frequency dispersive propagation, phase velocity and group velocity. Magnetic vector potential for sources in free space.	7	1,2,4

60	20	10	10	-	-	-	100	3	1	-	4

Prerequisites:
 Basic algebra, Differential equations, Trigonometry, Complex Arithmetic

Course Objective:
 This course introduces the fundamental concepts of signals and system. These concepts form the building blocks of modern digital signal processing, communication and control systems. Hence, a sound understanding of these concepts is necessary for all students of Electronics and Communication Engineering. The course will cover various basic tools of signal and system analysis such as signal classification, LTI systems, Properties of LTI Systems, Frequency Response, Laplace Transform, Z-Transform, Fourier Transform, Fourier Series, Discrete Time Fourier Transform (DTFT), Discrete Fourier Transform (DFT), Cascade/ Parallel structures and their various practical applications. Various concepts such as convolution, impulse/ frequency response, causality, stability of systems will be especially emphasized. This course is suitable for all UG students who are looking to build the fundamental concepts of signals and systems as well as students preparing for their competitive exams.

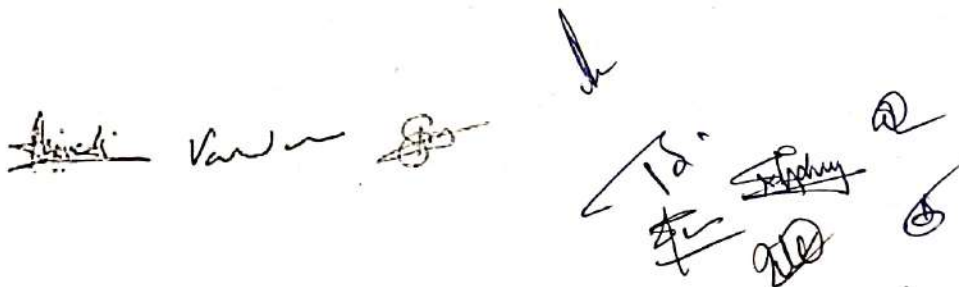

Course Outcomes:
Upon completion of this course, the student will be able to-
 CO1: Discriminate the nature of the given signals and systems.
 CO2: Analyze Linear Time Invariant Systems (LTI) and its representation.
 CO3: Analyze the discrete and continuous time signals and systems in frequency domain.
 CO4: Understand the process of sampling and the effects of under sampling.
 CO5: Compute the response of an LTI system in the time and frequency domains.

Prerequisites:

Course Objective:

To introduce the concepts of analog communication systems, and to equip students with various issues related to analog communication such as modulation, demodulation, transmitters and receivers and noise performance.

Course Outcomes:

After completion of the course, students would be able to -

- CO 1: Acquire knowledge of signal and its properties, understand and demonstrate about different modulation, demodulation techniques of analog signals. (BL1,BL2)
- CO 2: Conduct analysis of baseband signals in time domain and frequency domain. Analyse error performance of a communication system in presence of noise and other interference. (BL3,BL4)
- CO 3: Design communication systems to meet desired needs.(BL3,BL6)
- CO4: Evaluate the performance of modulation and demodulation techniques in various transmission environments. And evaluate fundamental communication system parameters such as bandwidth, power and signal to noise ratio.(BL3,BL5)

To able to think and communicate in English effectively is a major skill for the engineering graduates. Ability to communicate persuasively not only promotes confidence but also gives a feeling of being authoritative. Practicing speaking and communicating to hone your communication skills has no substitute. Regular practice improves competence, fluency and vocabulary. Hard-work and persistence establishes success.											
Course Objective:											
To enable students to communicate in English professionally. The course will make the students able enough to converse in English. After completing the course, the students will be able to represent themselves better. Public speaking improves performance skills, encourages Behavioral change, enhances writing skills and develops leadership skills.											
Course Outcomes:											
After completion of the course student will be able											
CO1		To learn to think in English and to speak without translation									
CO2		To learn better oral communication skills.									
CO3		To improve fluency and confidence for better speaking and writing skills
